SKILL

PROGRAMING LANGUAGES

- Dart
- JavaScript
- HTML
- CSS

FRAMEWORKS & LIBRARIES

- Flutter
- React Vite
- Node.js
- Express

DATABASES

- Firebase
- Supabase
- MongoDB
- MySQL

TOOLS

- Figma
- Draw.io
- Git
- VScode

EDUCATION

SILPAKORN UNIVERSITY

Bachelor of Science in Information Technology
June 2021 - August 2025 GPA 3.06

ABOUT ME

Recent graduate in Information Technology with a foundation in both **web and mobile application** development. Proficient in building web applications using **React Vite** and creating cross-platform mobile apps with **Flutter**, as demonstrated in my thesis project. I'm also skilled in UI/UX design using **Figma** and adept at version control with **Git**.

BACHELOR'S THESIS

NFC DECK TRACKER : MOBILE APPLICATION

A mobile application developed with **Flutter** under the concept of **Clean Architecture**. This project was inspired by my interest in merging physical objects with digital data, a concept I learned in my IoT class. With my extensive experience as a card game player, I wondered if I could create a tool for real-world card games that would work similarly to the Hearthstone Deck Tracker software used to track card plays in the digital card game Hearthstone.

However, current methods of tracking physical card games often rely on manual recording, which is inconvenient and limiting. Therefore, I proposed a new approach using **NFC (Near-Field Communication)** to read and write card data. Since modern smartphones already support this technology, it provides easy access and a seamless user experience. This approach not only facilitates game tracking but also opens up opportunities for further development, such as connecting to smart playmats. This project demonstrates my ability to identify problems and develop new solutions powered by technology and innovation to create new experiences that meet both current and future needs.

This application supports both Google login with **Firebase** cloud storage and guest access using **SQLite** locally. Users can build decks from cards retrieved via an adaptive external **API**, designed to accommodate future game expansions, or create custom cards with images stored in **Supabase**. Card data can be written to NFC tags, enabling players to scan and track their decks both during setup and actual gameplay, with real-time updates on card status. The app also records play statistics and history, and provides customizable settings such as language and theme preferences
