Summary

Designs, builds and runs a factory's systems end to end, from on-premise servers to in-house software. Sole IT for a 230-person automotive parts factory: moved it from separate Excel files and paid services to a self-hosted platform and a central ERP, cutting IT costs by THB 45,200/year. Making the complex simple.

Skills

Systems & Infrastructure: Linux, Proxmox (clustering, replication), virtualization, backup & recovery, networking, VPN

DevOps & Automation: Docker, Nginx, Git, Vercel, monitoring (Uptime Kuma, Wazuh), workflow automation (n8n)

Context Engineering: Claude Code with project docs, decision records, coding rules, commit checks and review subagents

Software Engineering: Next.js, React, TypeScript, Node.js, PostgreSQL, C#, Python

Languages: Thai (Native), English (Working proficiency)

Work Experience

IT Coordinator
Nozomi Enterprise (Thailand) Nov 2025 — Present

- Replaced per-department Excel files with a central ERP, designed and delivered single-handedly: 14 modules with role-based access and an audit trail; bill of materials, marketing, purchasing and production use it daily, with store and delivery being built.
- Built the bilingual (English / Japanese) company website for clients in Thailand and Japan; all text lives outside the code, so contacts, certifications and product photos are updated in one place.
- Turned two repurposed desktops into the company's first servers and grew them into a three-machine setup: core systems copied to a standby server every 15 minutes, nightly backups verified weekly, and a written recovery procedure.
- Built four-layer monitoring (25 service checks, an external heartbeat for site-wide outages, security events, failed backup jobs) plus a daily disk and backup health check, so issues surface before users report them.
- Delivered remote access over an encrypted VPN with per-person access, backed by two internet lines with load balancing and failover.
- Cut IT costs by THB 45,200/year by moving files from a paid cloud service to the in-house file server and replacing paid antivirus with Windows Defender; 35 computers now report to a self-hosted security dashboard (Wazuh).
- Built a Discord bot and n8n workflows that draft quality-register entries and write them only after one-click human approval, with NFC asset lookup and AI triage of IT email.
- Moved nearly all IT quality documents (IATF 16949 / ISO 9001) to digital files; passed the first audit with no action requests.

Selected Projects

- **Suwisa**: A Discord bot on my home server that reads Thai receipts to track spending, no AI API. Python · Docker
- **Crossword Solver**: Solves a crossword game from a screenshot by reading the grid and backtracking. Java
- **Window Share**: A VS Code extension that shows another window live inside the editor. TypeScript · PowerShell
- **Play-Time**: Tracks time in chosen programs like Steam's playtime, with tamper-resistant storage. C# · WinForms

Education

B.Sc. Information Technology 2021 — 2025
Silpakorn University — graduation project: an NFC card-tracking app
